

• Toxoplasma gondii .

- intracellular parasite of neurons.

predator → prey

prey attracted to the predators
more active, 'bolder'

• SPECIFICITY .

- by sexual attraction?

• categories of change .

changes in activity . (up or down)

reduced speed, explore more/less

→ might increase predation

• vectors tend to be less affected .

[mosquito w/ filarial parasites, malaria
do fly less

conspicuous behavior

fish, ants

behavioural fever

changes in social behaviour

changes in mating behaviour.

test/think about manipulation?

parasite
fitness

host
fitness

host pathology

0/+

+

tolerance

• mechanisms . (organ systems)

~ sensory organs

~ gonads

~ central nervous system

(immune privilege)

a lot of these changes? non-adaptive?

syphilis, prion disease

~ rabies .

Changes in nutritional status.

host might decrease activity
increase

- damage to gut

- (behavioural) fever

malarial fever increases BMR by 40%

TESTING

• experimental infection .

? allow or block change in phenotype

? evaluate host/parasite fitness

? evaluate transmission

- FIELD STUDIES -
